Psychoeducational Assessment

A Psychoeducational Assessment (often referred to interchangeably with the term Neuropsychological Assessment) uses standardized evaluation procedures to describe your child's functioning in skills such as attention, memory, language, perception, coordination, and social-emotional. Areas assessed may include attention, executive functioning (organization, planning, etc.), general cognitive abilities, language, visual-spatial skills, learning and memory, behavioral and emotional functioning, motor skills, and academic achievement. Some abilities may be measured in more detail than others, depending upon your child's individual needs.

A Psychoeducational Assessment can provide helpful information in a variety of situations, such as:

- If your child is not progressing at the rate you think they should be. For example, they cannot remember information repeatedly practiced.
- If your child is struggling academically and not making progress even after receiving assistance from adults
- If you feel that your child's has behaviors such as forgetfulness, difficulty organizing belongings, inability to respond and /or perform consistently
- If your child is school avoidant and anxious regarding school and performance

What can I expect during the assessment?

- An interview with parents that involves a detailed developmental history
- Observation and evaluation of your child's cognitive skills, language, attention, executive functions, and social-emotional skills
- Evaluation of your child's pre-academic or academic skills, adaptive skills, and behavioral functioning using standardized assessment measures
- Identification of your child's strengths which can promote positive self-esteem, as well as developmental needs.

Our primary goal to provide you with a clear understanding of your child's learning style and how you can best support your child, by working with their strengths and targeting their development areas.

Kate Roberts & Associates

After the Assessment

- A comprehensive report and feedback about your child's current strengths and weaknesses
- Individualized educational and treatment plan recommendations
- Recommendations about how to best intervene to promote your child's optimal development
- Address parent-child interaction and provide school consultation if requested
